

Next part is "Change"

Consider the graph  $c(t) = \cos t$  as function of time.

$$\begin{aligned}\text{slope} &= m \\ &= \frac{\text{rise}}{\text{run}} \\ &= \frac{\Delta C}{\Delta t}\end{aligned}$$

Observations :

- straight line - so a linear function
- linear function is  $c(t) = \underset{\uparrow}{mt} + \underset{\nwarrow}{b}$

slope  
=  $\frac{\text{rise}}{\text{run}}$   
=  $\frac{\text{change in } y}{\text{change in } x}$

- linear function has a constant slope

We get the same slope  
no matter what 2 points  
on the line we pick

points differ, but ratio will be the same

Compare this to

calculus is designed  
to help us:-

- measure
  - describe
  - predict
- how change occurs.

more complicated pattern of charge  
the way  $f$  changes is actually  
changing over time
